digital business solution

d.velop office integration for SAP ERP

Simplify your work day
with efficient template management

d.velop

Most businesses use Microsoft Office to create and process documents. Depending on the department, the same Word and Excel documents are often used repeatedly. These documents usually need to have the same format and design. Generally, businesses rely on templates for documents that are used frequently. Once created, these documents are then made available to the employees; however, some employees spend a lot of time recreating the documents again and again.
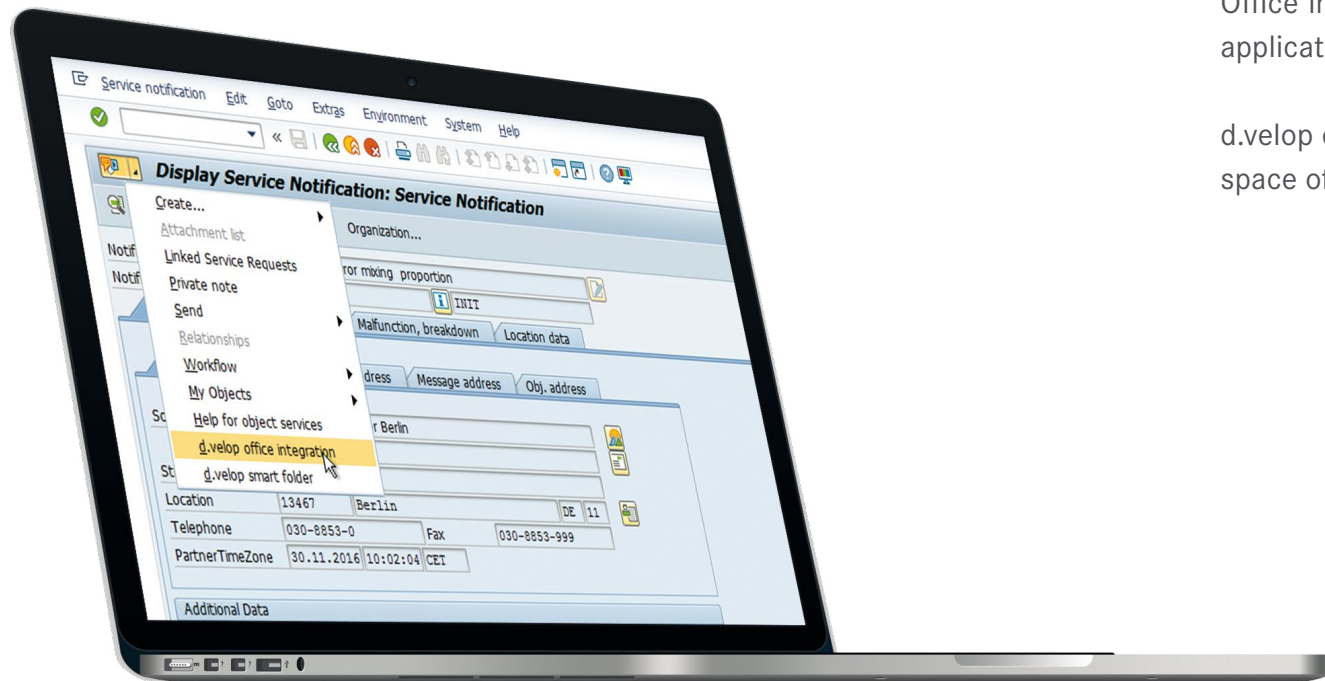

Attachments can be optimized with an integrated template management system. In this way, you not only increase efficiency and avoid unnecessary effort, but also increase the tendency to reuse templates that have already been created. In addition, your documents have a unified appearance that makes them easy to recognize. d.velop office integration for SAP ERP is a simple, automated template management system for your SAP ERP system. The system supports you throughout the document process, from

creation and editing to the integration of Microsoft Office documents in your SAP system and in the d.velop Enterprise Content Management system d.3ecm or the ecspand Repository.

Consistent document processes thanks to d.velop

You no longer have to exit the respective application to create documents. Templates that have been created using Microsoft Office are simply placed into your content repository and can be opened directly from the SAP transaction. Documents are automatically pre-filled with the necessary information from SAP. During backup, the new document is placed in the corresponding content repository and a link entry is created in SAP. Regardless of the department, whether it's accounting, controlling, distribution, purchasing or production, employees have access to the document templates needed for their everyday work.

d.velop office integration for SAP ERP is positioned in the SAP interface

Templates for Word and Excel documents are available. In these Office templates, bookmarks are created and linked to SAP values from the respective SAP Business Objects. These settings are created using "Customizing" in SAP ERP. Templates have a simple processing status: Processing or Release. Released documents can subsequently be displayed and retrieved in the attachment lists (Generic Object Services) for the user. Office integration can then be retrieved using Generic Object Services or through an application.

d.velop office integration for SAP ERP has been developed in the protected SAP namespace of d.velop AG and is provided in the form of external SAP transports.
